Overview

Introduction to Heading Tags

Different Heading Tags

Introduction to Heading Tags

- HTML headings are used to define the hierarchy and structure of content on a web page.

- Headings are important for both search engines and users, as they provide a clear and organized way of understanding the content.

Example of Headings

- Non-semantic elements in HTML are HTML tags that do not carry any specific meaning or convey any structural information about the content on a web page.

- These elements are used for styling or layout purposes, and do not add any semantic value to the content.

Examples Headings Elements

Headings

Heading 1

Heading 2

Heading 3

Heading 4

Heading 5

Heading 6

Denote sections of the document

H1 is the primary heading for the document
- **Should only appear once per page**

H2 – H6 are secondary headings
