Introduction to Formatting Elements

- Formatting elements in HTML are used to apply visual styling or formatting to content on a web page.

- These elements allow web developers to control the appearance of text and other content, and can be used to enhance the visual appeal and readability of a web page.

Examples Formatting Elements

- **<b> and <strong>:** These elements are used to make text bold.

- **<i> and <em>:** These elements are used to make text italicized.

- **<u>:** This element is used to underline text.

- **<strike>:** This element is used to strike through text.

- **<sub> and <sup>:** These elements are used to create subscript and superscript text, respectively.

- **<code>:** This element is used to represent computer code or program code.

- **<pre>:** This element is used to preserve white space and formatting within text.

- **<blockquote>:** This element is used to indicate a longer quotation or block of text.
